

Getting Info on StreamSets Queued Jobs

This document describes how to get information about StreamSets queued Jobs.

Consider an engine with a [Max Running Pipeline Count](#) of 5 that has 8 Jobs scheduled to run on it. Five Jobs should transition to an Active (green) Job Status and show a Pipeline status of Running (green), while three Jobs should show an Active (red) Job Status with no pipeline status, like this:

Job Instances (66 with current filters)

☐ 	Name	Pipeline	Version	Last Modified On ↓	Job Status	Pipeline Status
☐ 	JT2 - 3	NEW_PIPELINE_25	v1	3 minutes ago	ACTIVE	
☐ 	JT2 - 2	NEW_PIPELINE_25	v1	3 minutes ago	ACTIVE	
☐ 	JT2 - 1	NEW_PIPELINE_25	v1	3 minutes ago	ACTIVE	
☐ 	JT - 5	NEW_PIPELINE_25	v1	3 minutes ago	ACTIVE	RUNNING
☐ 	JT - 4	NEW_PIPELINE_25	v1	3 minutes ago	ACTIVE	RUNNING
☐ 	JT - 3	NEW_PIPELINE_25	v1	3 minutes ago	ACTIVE	RUNNING
☐ 	JT - 2	NEW_PIPELINE_25	v1	3 minutes ago	ACTIVE	RUNNING
☐ 	JT - 1	NEW_PIPELINE_25	v1	3 minutes ago	ACTIVE	RUNNING

The three Jobs with Active (red) Job Status with no pipeline status are referred to as “queued” Jobs.

When one of the Active (green) Jobs completes and transitions to Inactive, a slot will be freed up and one of the queued Jobs will then transition to an Active (green) Job Status and show a Pipeline status of Running (green).

In the Control Hub Job Instance List, one can create and save a filter named 'Queued' with the filter criteria Job Status includes ACTIVE and Job Status Color includes Red and look for entries with no Pipeline Status, like this:

The screenshot shows the Control Hub Job Instance List interface. At the top, there are filter criteria: 'Job Status' includes 'ACTIVE' and 'Job Status Color' includes 'Red'. A 'Search' button is below the filters. On the right, there is a dropdown menu with options: 'Job Status Color: Green', 'Job Status Color: Red', and 'Queued'. The 'Queued' option is highlighted. Below the filters, the table shows 'Job Instances (3 with current filters)'. The table has columns: Name, Pipeline, Version, Last Modified On, Job Stat, and Pipeline Status. Three job instances are listed, all with 'ACTIVE' status and '10 minutes ago' last modified. The first three rows of the table are highlighted with a red box.

	Name	Pipeline	Version	Last Modified On	Job Stat	Pipeline Status
☐	JT2 - 3	NEW_PIPEL...	v1	10 minutes ago	ACTIVE	
☐	JT2 - 2	NEW_PIPEL...	v1	10 minutes ago	ACTIVE	
☐	JT2 - 1	NEW_PIPEL...	v1	10 minutes ago	ACTIVE	

Items per page: 50 1 - 3 of 3

→ One can see that those Jobs have been queued for ~ 10 minutes.

Additionally, one can use a StreamSets Python SDK script to retrieve a list of queued Jobs, as shown on the next page.

```

# File get-queued-jobs.py

from streamsets.sdk import ControlHub
from datetime import datetime
import os

cred_id = os.getenv('CRED_ID')
cred_token = os.getenv('CRED_TOKEN')

# Connect to Control Hub
sch = ControlHub(credential_id=cred_id,token=cred_token)

# Find queued Jobs
for job in sch.jobs:
    job_status = job.status
    if (job_status.status == 'ACTIVE' and
        job_status.color == 'RED' and
        len(job_status.pipeline_status) == 0):
        last_modified_time =
datetime.fromtimestamp(job.last_modified_on/1000.0)
        print('Job {} has been queued since {}'.format(job.job_name,
last_modified_time))

```

That script will produce output like this:

```

$ python get-queued-jobs.py
Job JT2 - 1 has been queued since 2025-05-02 14:26:37.593000
Job JT2 - 2 has been queued since 2025-05-02 14:26:37.596000
Job JT2 - 3 has been queued since 2025-05-02 14:26:37.599000

```
